[1] Operating temperature at higher temperatures is possible with reduced current and power ratings

[2] In case of forced cooling (conduction or ventilation): a) the ambient temperature requirements may be extended substantially as long as the drive (PCB) temperature is kept below 85 ºC; b) the spacing requirements can be dropped down to zero; c) the surface temperature will decrease accordingly

[3] Micro 4804 can be operated in vacuum (no altitude restriction), but at altitudes over 2,500m, current and power rating are reduced due to thermal dissipation efficiency.

[4] For current values >4A_{RMS}, pins J1/2…8 may need to be soldered instead of socketed, for long-term reliability – check socket manufacturer specifications.

[5] Fast loop period of 50µs is not possible with all feedback device types.
